

ETHEREUM

Decentralized Systems

Presented by: [Name] @[twitter handle]

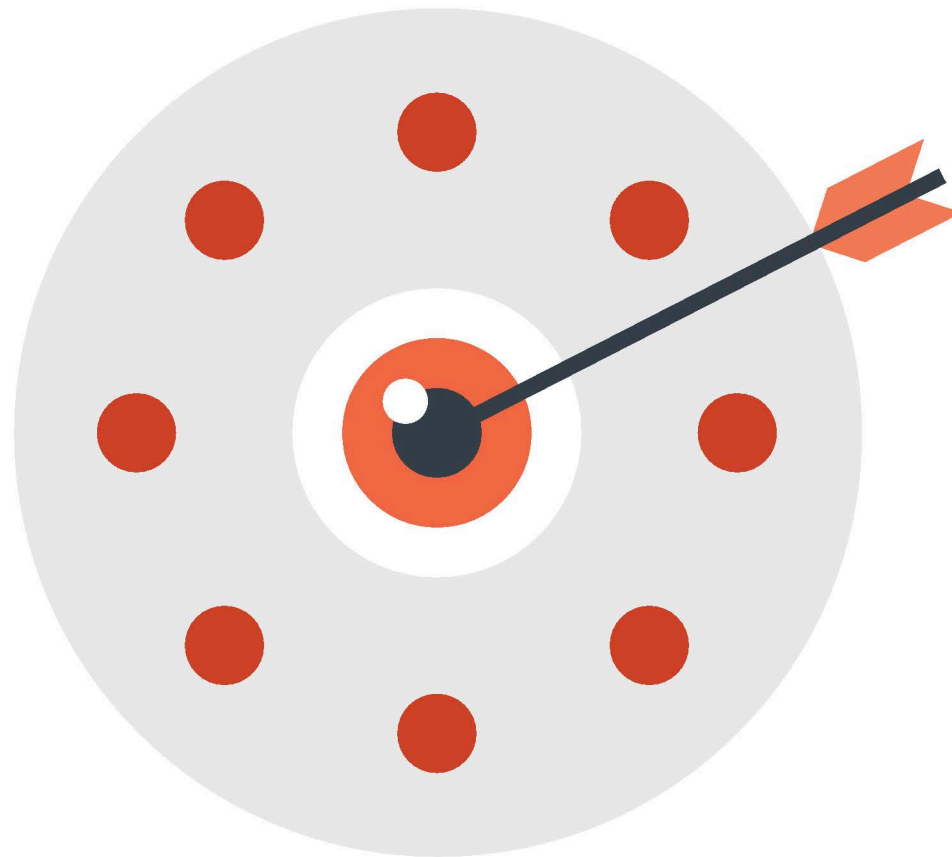

Part of the Ethereum 101 Series: www.ethereum101.org

CENTRALIZED SYSTEMS

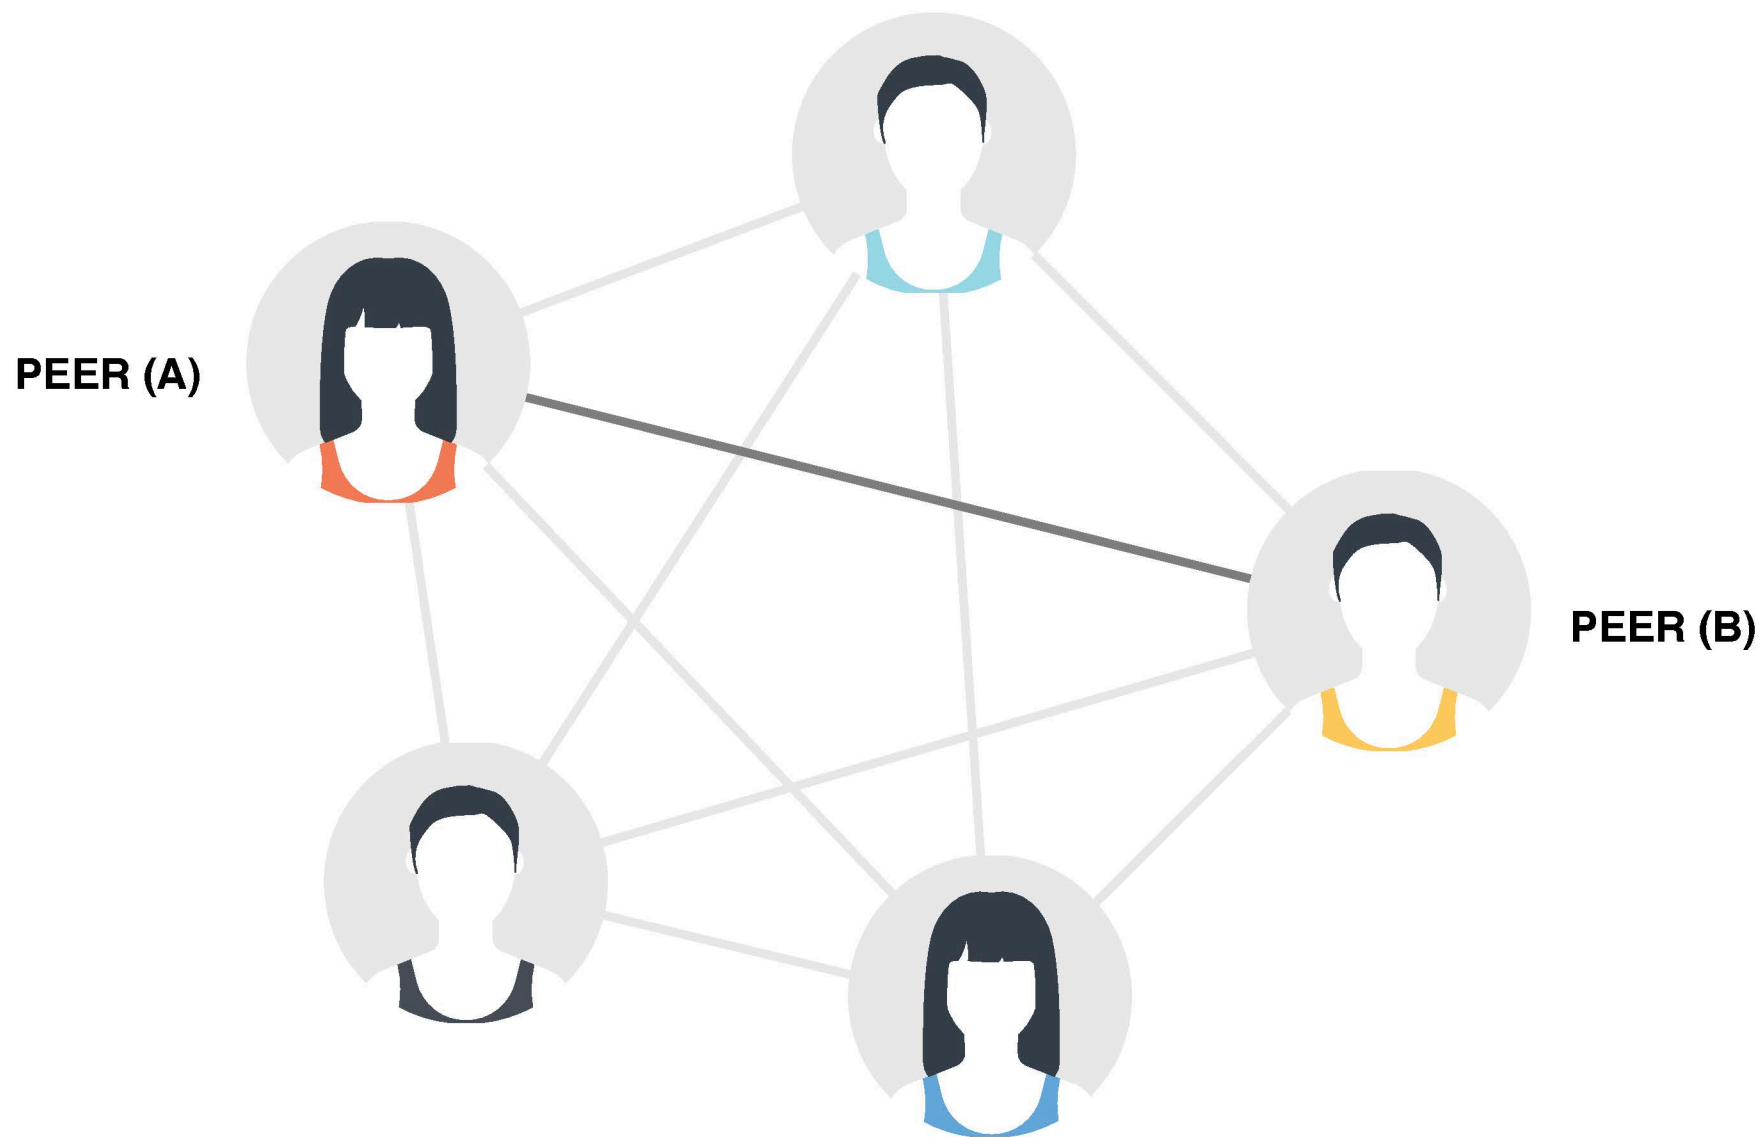

Information and control are held by a centralized source.

CENTRALIZED SYSTEMS

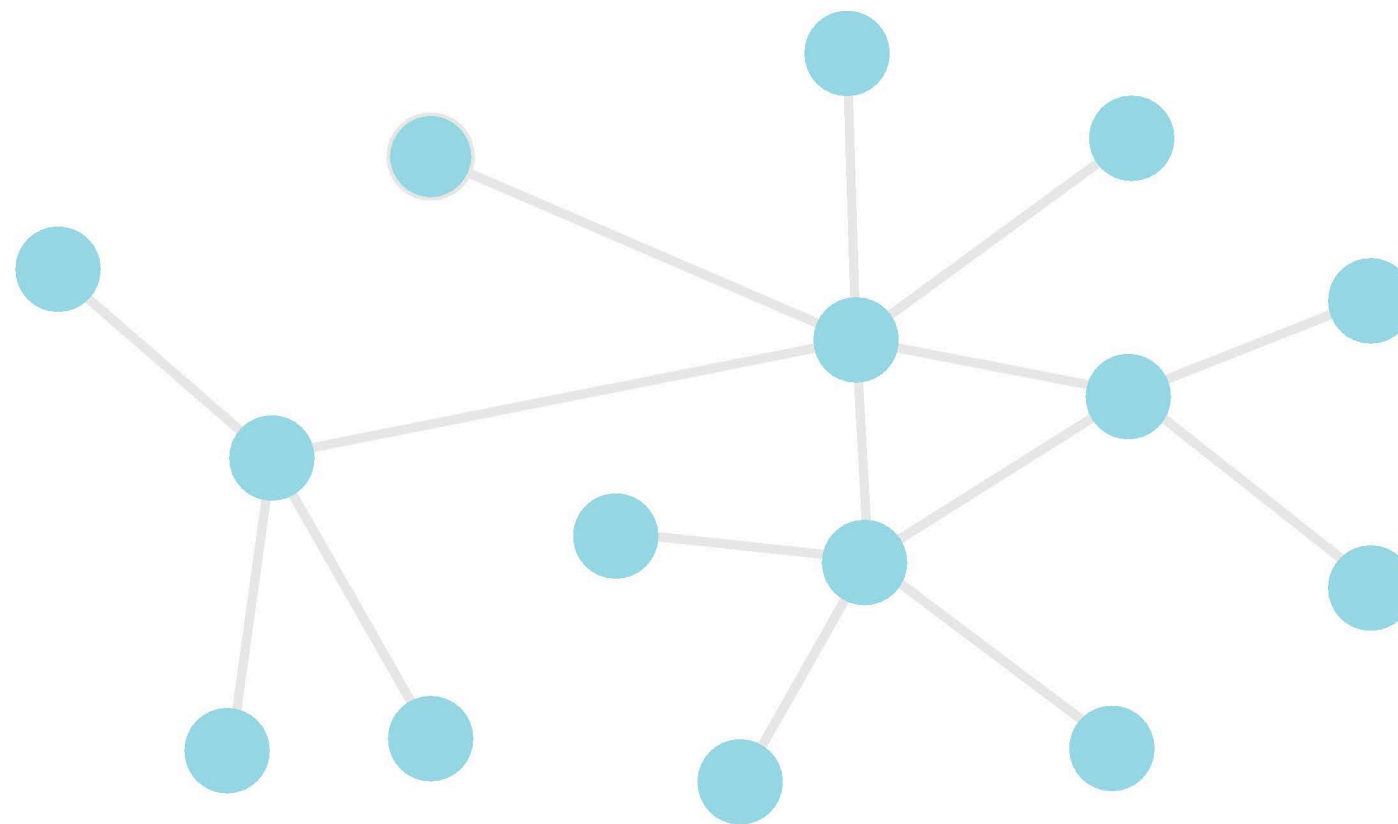

If the main node fails, the entire network fails.

DECENTRALIZED SYSTEMS

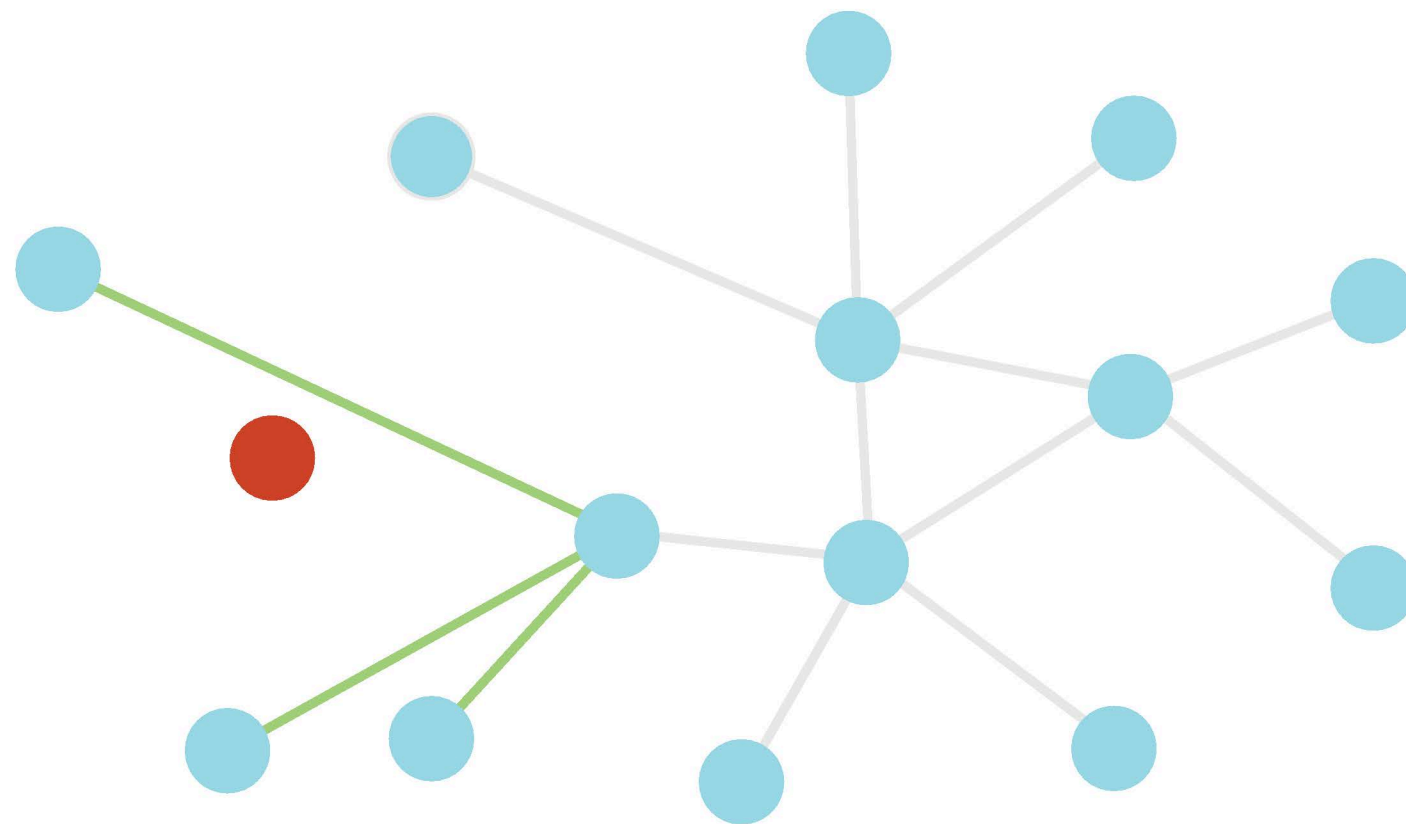

Decentralized networks are also known as peer-to-peer, or P2P.
The network is a connection of nodes known as peers.

DECENTRALIZED SYSTEMS

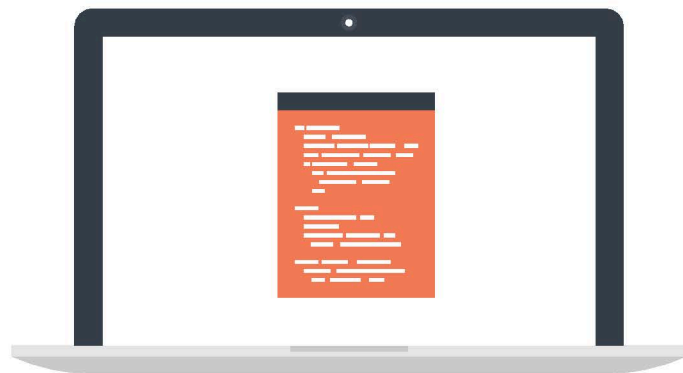

Information and control are distributed in a peer-to-peer network.

DECENTRALIZED SYSTEMS

If a node fails, the network can easily repair itself.

CENTRALIZED VS DECENTRALIZED

If you save a file on your computer, and the hard drive fails, you lose all the data on it - forever.

Cloud services help store multiple copies of your file, keeping it safe in the case of a hard drive failure.

Distribution of data and control leads to more fault-tolerant systems.
